this book is the only account of what honeybees actually see bees detect some visual features such as edges and colours but there is no sign that they reconstruct patterns or put together features to form objects bees detect motion but have no perception of what it is that moves and certainly they do not recognize things by their shapes yet they clearly see well enough to fly and find food with a minute brain bee vision is therefore relevant to the construction of simple artificial visual systems for example for mobile robots the surprising conclusion is that bee vision is adapted to the recognition of places not things in this volume adrian horridge also sets out the curious and contentious history of how bee vision came to be understood with an account of a century of neglect of old experimental results errors of interpretation sharp disagreements and failures of the scientific method the design of the experiments and the methods of making inferences from observations are also critically examined with the conclusion that scientists are often hesitant imperfect and misleading ignore the work of others and fail to consider alternative explanations the erratic path to understanding makes interesting reading for anyone with an interest in the workings of science but particularly those researching insect vision and invertebrate sensory systems

progress in fluid mechanics depends heavily on the availability of good experimental data which can inspire new ideas and concepts but which are also necessary to check and validate theories and numerical calculations with the advent of new recording and image analysis techniques new and promising experimental methods in fluid flows have presented themselves which are rather newly developed techniques such as particle tracking velocimetry ptv particle image velocimetry piv and laser fluorescence lif this volume presents state of the art research on these techniques and their application to fluid flow selected papers from the euromech conference on image analysis are published in this volume

this book presents a collection of articles reflecting state of the art research in visual perception specifically concentrating on neural correlates of perception each section addresses one of the main topics in vision research today part 2 fundamentals of awareness multi sensory integration and high order perception covers topics from filling in to visual awareness to crossmodal interactions a variety of methodological approaches are represented including single neuron recordings fmri and optical imaging psychophysics eye movement characterization and computational modelling the contributions will provide the reader with a valuable perspective on the current status of vision research and more importantly with critical insight into future research directions and the discoveries yet to come provides a detailed breakdown of the neural and psychophysical bases of perception presents never before published original discoveries includes multiple full color illustrations
